Computer Networking: Security

(CSE 3752)

Experiment 3

Aim:

Creating and implementing a user access list for permit and deny the remote hosts.

Objectives:

1. An overview on standard and extended access list.
2. Configuration and verification of a standard access list for permit and deny to a remote server.
3. Configuration and verification of an extended access list for permit and deny to a remote server (HTTP/FTP).

Exercises:

1. Briefly explain, why Access Control List (ACL) is important in network security.
2. Differentiate the use of standard and extended ACL.
3. With the help of appropriate commands explain how a list of IP addresses are blocked and another list of IP addresses are allowed by a router to justify the ACL configuration.
4. What is the purpose of a "wildcard mask" in ACLs, and how does it differ from a subnet mask?
